

Network basics

Simple network calls for SwiftUI

Network basics

- Cleartext HTTP calls are blocked by iOS
 - HTTPS is mandatory, or we need to turn off App Transport Security
- Network calls are handled by the URLSession class
- JSON encoding/decoding can be done using the Codable protocol

Codable

Encodable & Decodable

- Built-in way to encode / decode Swift types to other format
 - JSON and Property List are provided by default
 - We can build support for other formats
- Swift can auto-implement the protocol on a type automatically if all properties conform to Codable

```
struct Song: Codable {  
    var trackId: Int  
    var trackName: String  
    var artistName: String  
    var previewUrl: URL  
}  
  
struct ITMSResponse: Codable {  
    var results: [Song]  
}
```

```

struct Song: Codable {
    var trackId: Int
    var trackName: String
    var artistName: String
    var previewUrl: URL
}

```

```

struct ITMSResponse: Codable {
    var results: [Song]
}

```

```

}

```

```
func loadData() async {  
    guard let url = URL(string: "https://itunes.apple.com/search?term=pink+floyd&entity=song") else { return }  
    let request = URLRequest(url: url)  
  
    do {  
        let (data, _) = try await URLSession.shared.data(for: request)  
        //Handle network response  
    } catch {  
        print(error)  
    }  
}
```

```
func loadData() async {  
    guard let url = URL(string: "https://itunes.apple.com/search?term=pink+floyd&entity=song") else { return }  
    let request = URLRequest(url: url)  
  
    do {  
        let (data, _) = try await URLSession.shared.data(for: request)  
        //Handle network response  
    } catch {  
        print(error)  
    }  
}
```

```
func loadData() async {  
    guard let url = URL(string: "https://itunes.apple.com/search?term=pink+floyd&entity=song") else { return }  
    let request = URLRequest(url: url)  
  
    do {  
        let (data, _) = try await URLSession.shared.data(for: request)  
        let decodedResponse = try JSONDecoder().decode(ITMSResponse.self, from: data)  
        self.results = decodedResponse.results  
    } catch {  
        print(error)  
    }  
}
```

SwiftUI integration

- We can use URLSession and Codable to download and parse JSON
- We can call our function just before the SwiftUI view appears
 - Not on init, as the view is initialised everytime it changes

```
struct ContentView: View {  
    @State private var results = [Song]()  
  
    var body: some View {  
        List(results, id: \.trackId) { item in  
            HStack {  
                VStack(alignment: .leading) {  
                    Text(item.trackName)  
                        .font(.headline)  
                    Text(item.artistName)  
                }  
            }.task {  
                await loadData()  
            }  
        }  
  
        func loadData() async { }  
    }  
}
```

```

struct ContentView: View {

    @State private var results = [Song]()

    var body: some View {
        List(results, id: \.trackId) { item in
            HStack {
                VStack(alignment: .leading) {
                    Text(item.trackName)
                        .font(.headline)
                    Text(item.artistName)
                }
            }
        }.task {
            await loadData()
        }
    }

    func loadData() async { }
}

```
